```
country = "GRC"
```

Checking input data

Are all land cover of interest in the land transition matrix and all relationship included?

The structure of the matrix should be such that you have the same rownames and colnames. Check that you have all land covers, by default it should be cropland, forest, new forest, otherland, pasture and urban.

The matrix should be filled with the same number in each cell (i.e. the number of pixels for your country's grid representation in 50km x 50km)

```
##
##      cropland forest newforest otherland pasture urban
## cropland      126   126      126      126      126   126
## forest        126   126      126      126      126   126
## newforest      126   126      126      126      126   126
## otherland      126   126      126      126      126   126
## pasture        126   126      126      126      126   126
## urban          126   126      126      126      126   126
```

Downscaling

Looking at the land use changes projected in your calculator, are all land cover of interest in the land transition matrix and all relationship included?

The structure of the matrix should be such that you have the same rownames and colnames. Check that you have all land covers, by default it should be cropland, forest, new forest, otherland, pasture and urban.

The matrix should be filled with 10 in each cell (i.e. the number of year periods in the calculator). The diagonal should be filled with zeros.

```
##
##      cropland forest newforest otherland pasture urban
## cropland         0    10      10      10      10   10
## forest          10     0    10      10      10   10
## newforest        10    10     0    10      10   10
## otherland        10    10    10     0    10   10
## pasture          10    10    10    10     0   10
## urban            10    10    10    10    10    0
```
